How can we organize the recycling market?

Robobekia

introduction

Recycling can be defined as the process of converting waste into usable materials again. It also helps reduce energy use, reduce the use of new raw materials, reduce water and air pollution, in addition to reducing greenhouse gas emissions. They are considered an alternative to “traditional” waste disposal, which can save materials and help reduce greenhouse gas emissions.

The biggest obstacle in this industry will remain the dilemma of waste sorting, which is the vital issue on which the success of the industry depends or not. The beginning of any recycling work begins with sorting to facilitate the subsequent stages. The government and private sector companies are working hard to find a solution, but it is still not Effective enough so far.

122 Billion

The gain that is lost annually to Arab countries due to failure to recycle waste

200+ million tons

The volume of waste produced annually in the Arab world

92 million tons

The volume of waste produced annually in Egypt

The goal

We, as the “Robabikia team,” wanted to solve the problem of the recycling market, which is sorting waste and determining a clear path for waste from the hands of consumers to its exit from recycling factories as valuable products that can be traded in the markets again.

The solve

so, we have created a mobile application through which you can list the waste that you have so that a representative can come and take this waste to the Robobekia warehouses, where this waste is sorted to go to the recycling factories.
